

Network Automation 101

Ivan Pepelnjak (ip@ipSpace.net)
Network Architect

ipSpace.net AG

Who is Ivan Pepelnjak (@ioshints)

Past

- Kernel programmer, network OS and web developer
- Sysadmin, database admin, network engineer, CCIE
- Trainer, course developer, curriculum architect
- Team lead, CTO, business owner

Present

- Network architect, consultant, blogger, webinar and book author

Focus

- Network automation and SDN
- Large-scale data centers, clouds and network virtualization
- Scalable application design
- Core IP routing/MPLS, IPv6, VPN

**Every Well-Defined
Repeatable Task
Can Be Automated**

What Would You Automate?

Common answers:

- Device provisioning
- Service provisioning (= device configurations)
- VLANs
- ACLs
- Firewall rules

How about...

- Troubleshooting
- Consistency checks
- Routing adjustments
- Failure remediation

Automation

Repeatability

Consistency

Validation

**Automation = Eliminate
Repeatable Manual Tasks**

**Orchestration = Group
Automated Tasks in
Coordinated Workflows**

A Few Reasons for Lack of Network Automation

Major ones

- Mission-critical nature of the networks
- Unique snowflakes that are impossible to automate
- Ad-hoc solutions and non-standard kludges
- Blast radius
- Lack of trust

There's also

- Lack of programming skills
- Lack of reliable automation tools and programmatic interfaces
- Lack of (semi)standardized multi-vendor configuration schema
- Lack of affordable test environment

Hierarchy of Network Needs

Source: Jeremy Stretch, packetlife.net

Operated Network

Operated Network

- Box-by-box mentality
- Manual configuration through CLI
- Relationships between boxes are managed in brain-space
- Tight control of changes and maintenance windows due to inherently unreliable configuration processes

Immediate improvement opportunities

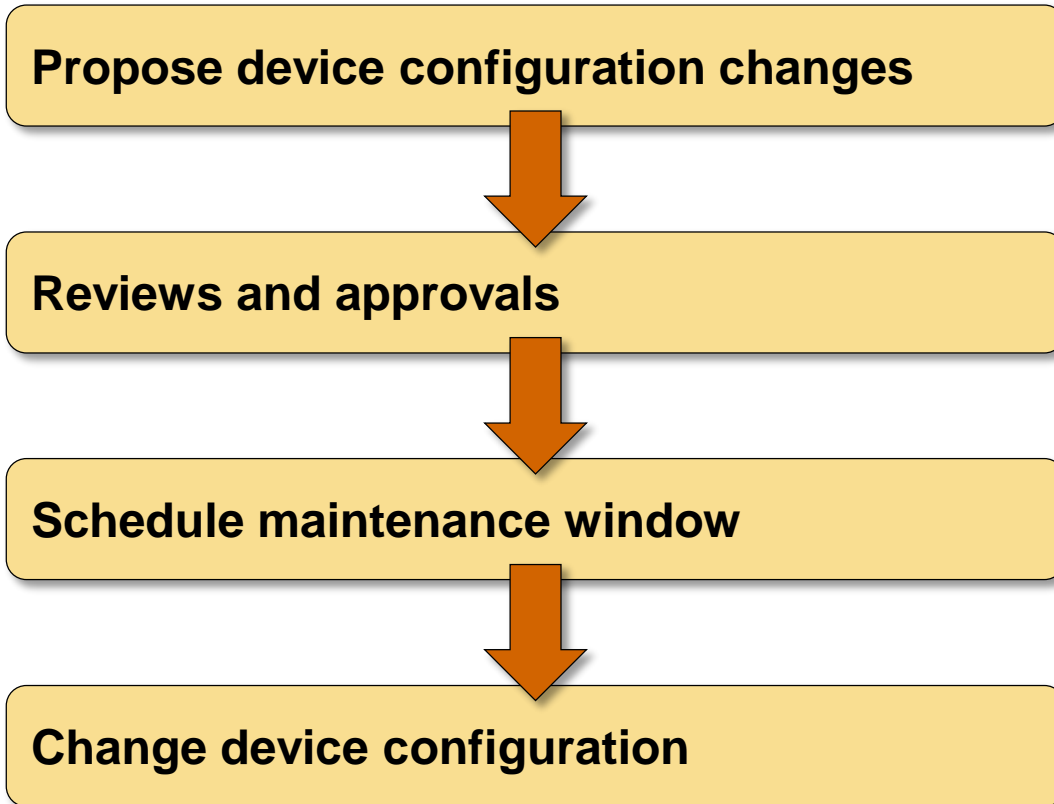

- Configuration repository = single source of truth
- Change tracking (version control)
- Configuration changes tied to user requirements or business needs

Tools to use

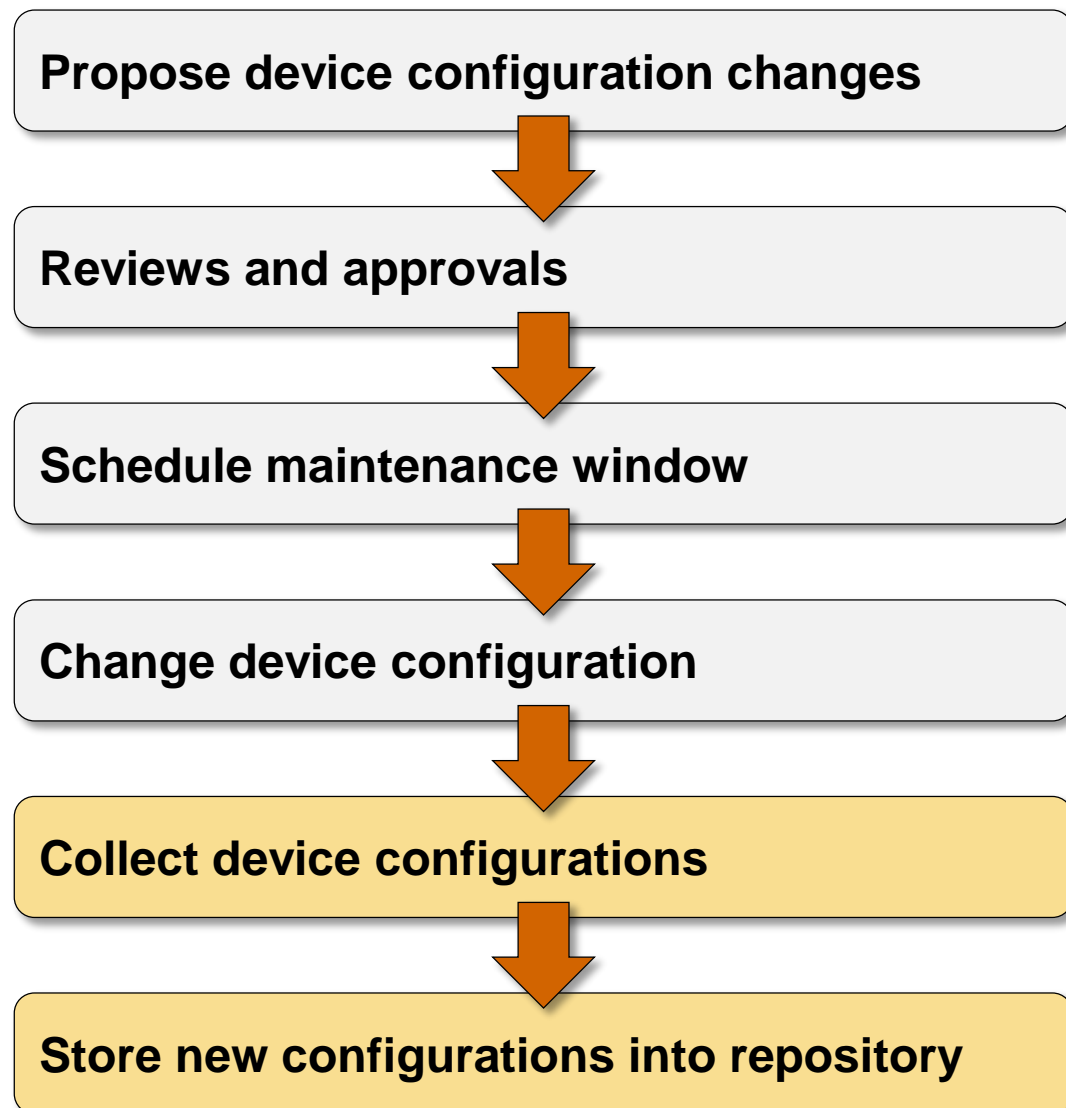

- RANCID – collect network configurations
- Subversion or Git – version control

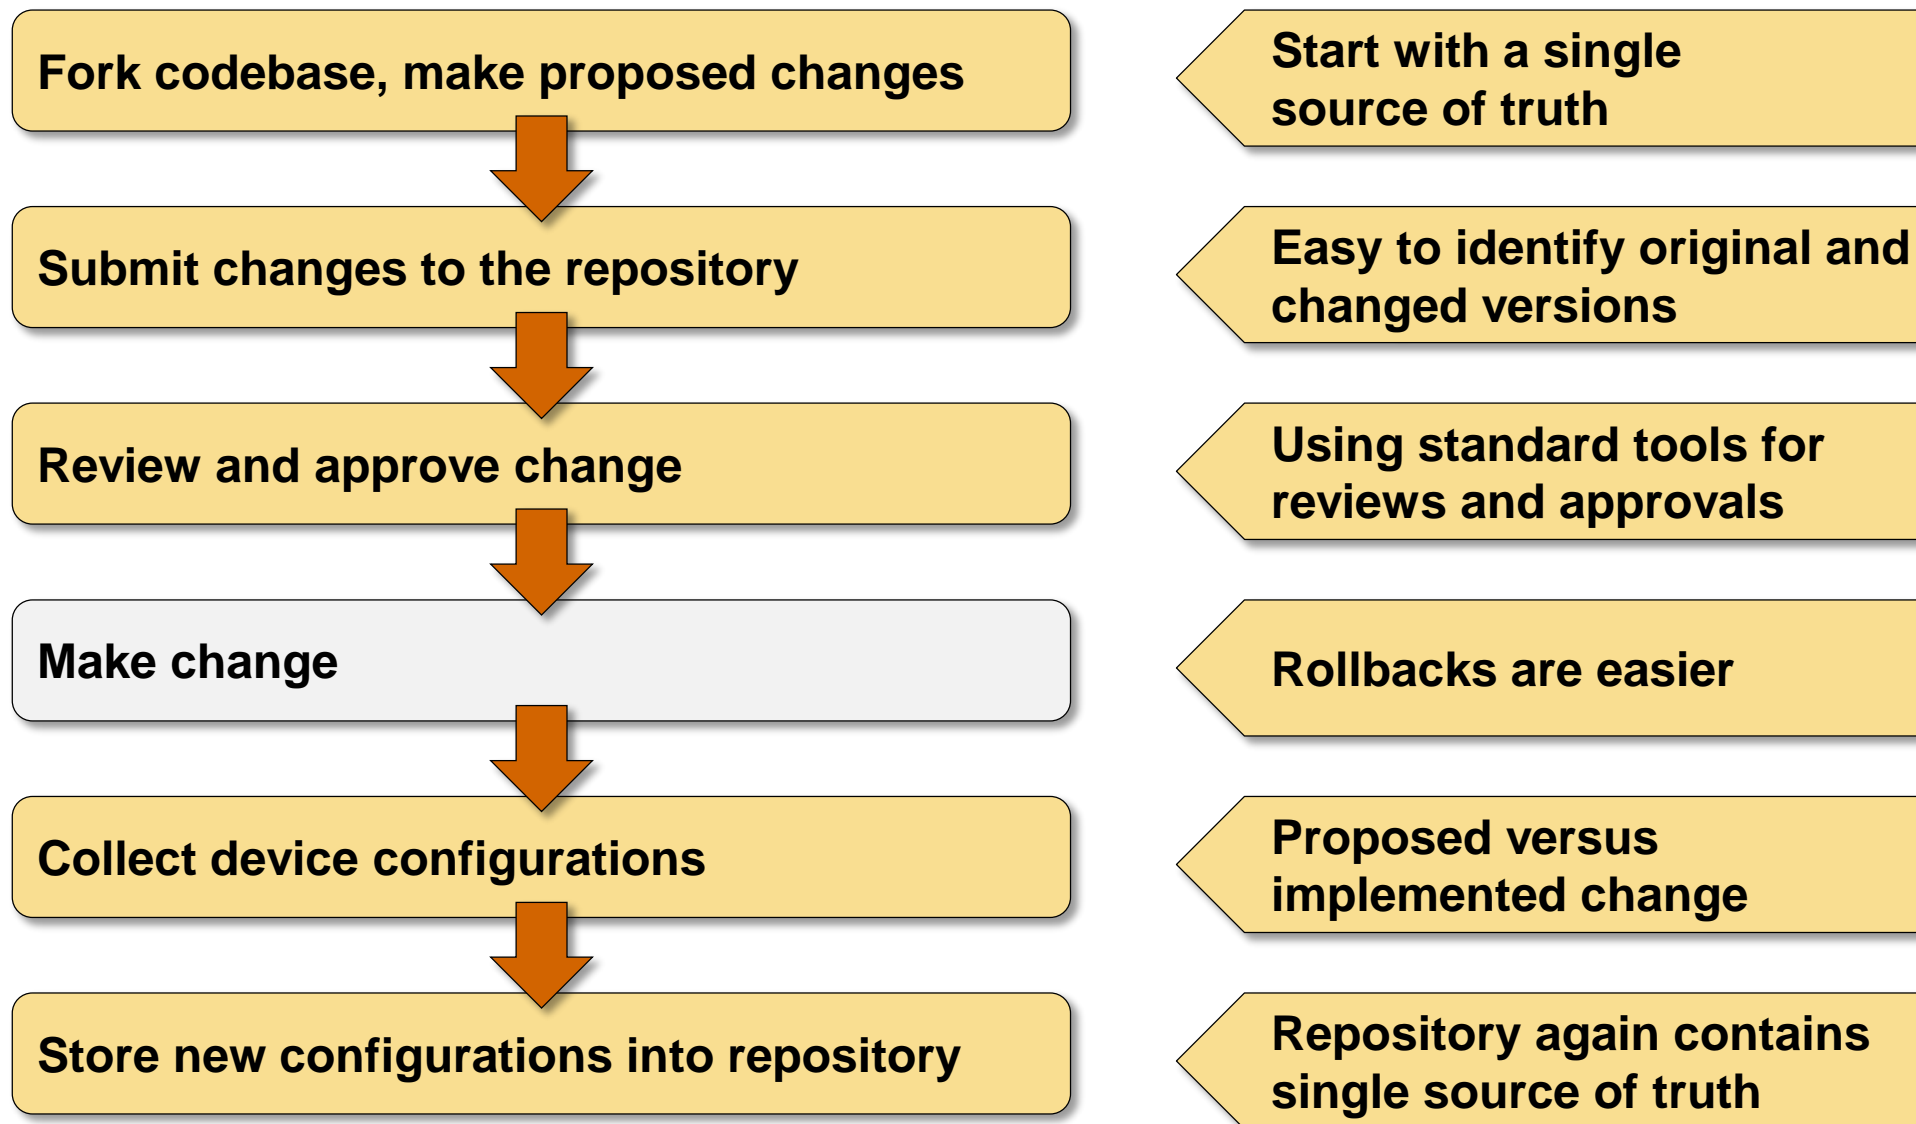

Typical Workflow

Store Device Configurations in a Repository

Start with Configuration Repository

The Final Twists

Fork codebase, make proposed changes

Submit changes to the repository

Review and approve change

Deploy changes automatically

Abstraction of Network State

Hierarchy of Network Needs

Source: Jeremy Stretch, packetlife.net

Simplify

Standardize

Abstract

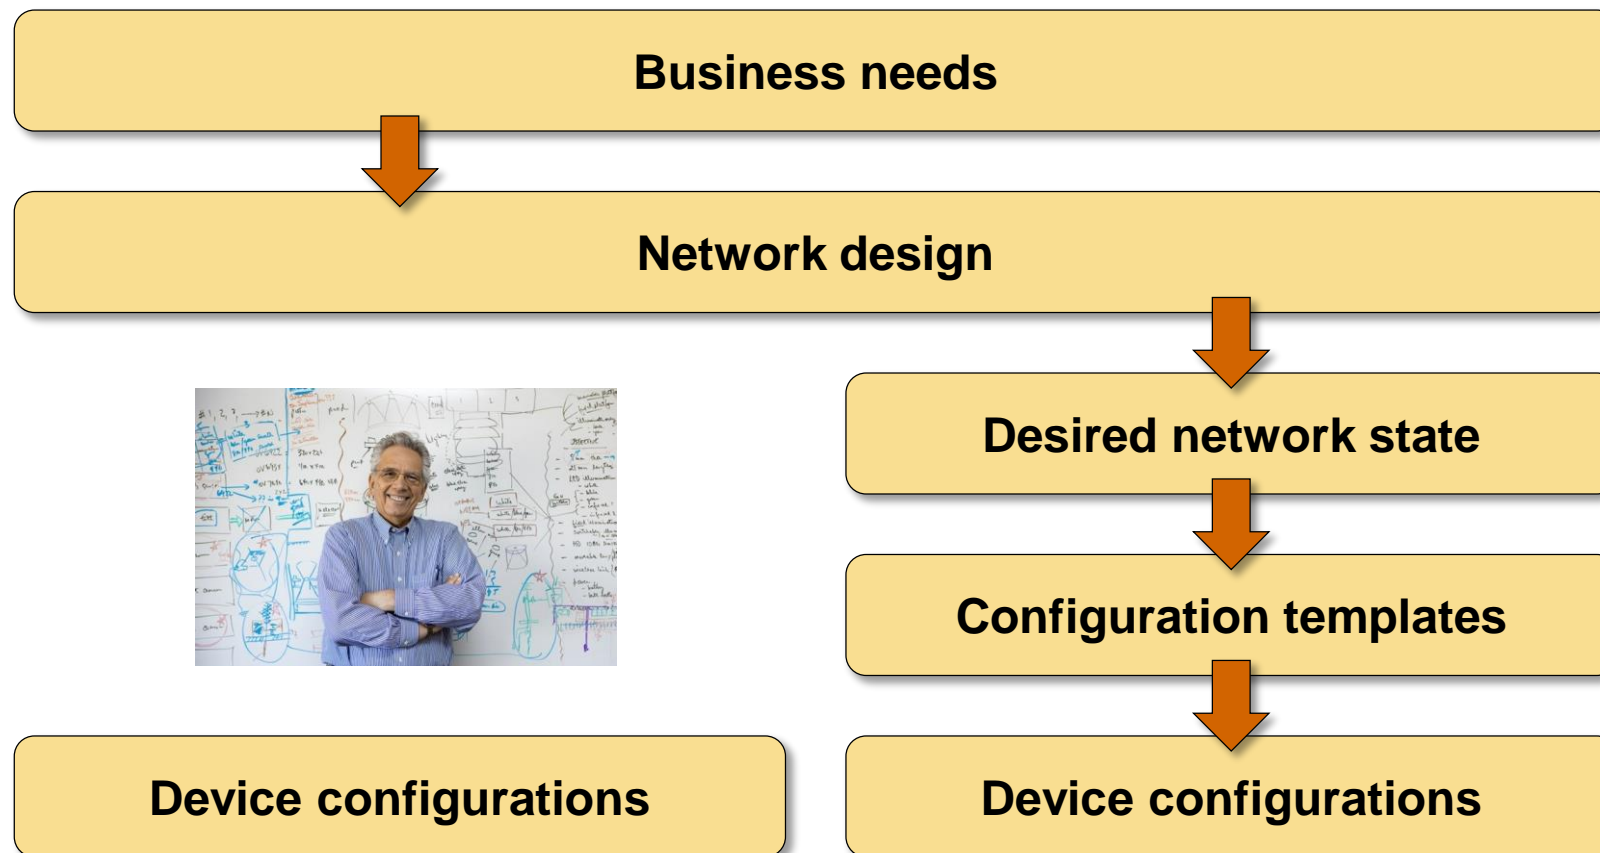

Automate

Network State Abstraction: Before and After

```
upgrade fpd auto
version 15.0
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname R2
!
boot-start-marker
boot-end-marker
!
logging buffered 4096
!
no aaa new-model
!
interface Loopback0
 ip address 10.0.1.5/32
!
!
interface Fa0/0
 ip address 172.16.11.1/24
...
```

```
hostname: 'R2'
loopback: { ip: 10.0.1.5 }
LAN:
  interface: 'Fa0/0'
  ip: 172.16.11.1
```

Network Deployment: Before and After

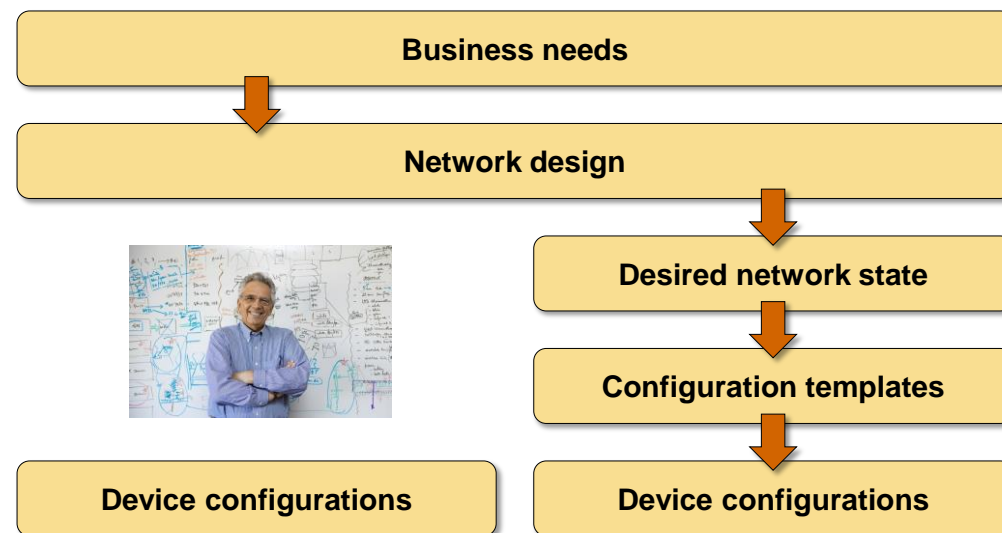

Benefits of Abstracted Network State

- Explicit mapping from network design to desired state and device configurations
- Separation of infrastructure state and service state
- Simplified multi-vendor deployments

Easier to:

- Validate configuration compliance
- Compare current state with desired state
- Identify mismatches or manual changes
- Change device configurations

Automatic Provisioning

Automated Network and Service Provisioning

Automation required by

- Large scale deployment
- Self-service requirements
- Faster service deployment
- Need to improve reliability

Prerequisites

- Standardized services, configurations and deployment processes
- Reliable method of configuring and monitoring network devices (API)

Tools to use

- Configuration state management tools: Chef, Puppet
- Automation frameworks: Ansible
- Workflow and continuous integration tools: Gerrit, Jenkins

Go for Low-Hanging Fruits

Read-Only Access

Device Provisioning

Service Provisioning

Traffic Rerouting

Real-Time and Data Plane

Automated Remediation

Automated Network Remediation

Holy Grail: Networks that fix themselves or adapt to changes

A few examples:

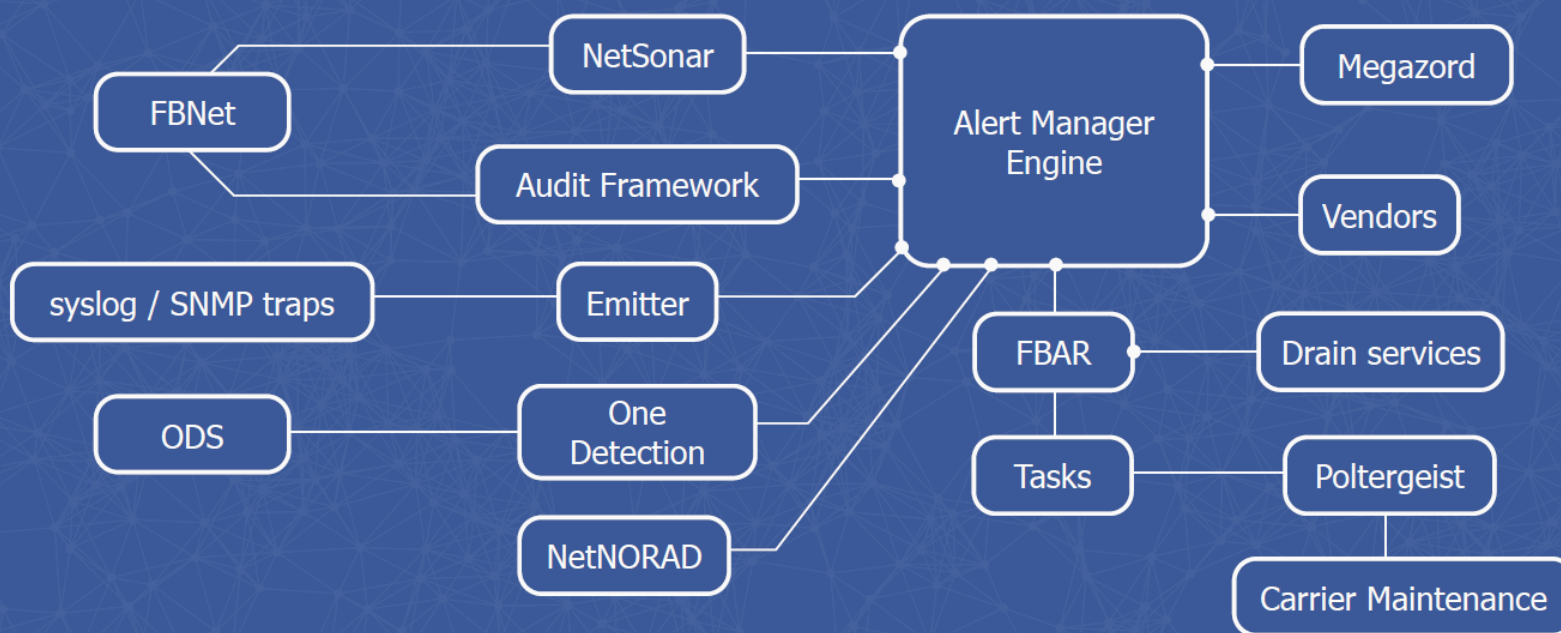

- Identify links with degraded performance → reroute traffic
- Identify router problems (memory leaks) → drain the traffic, reload the device
- ToR switch failure → migrate the virtual machines

Getting there:

- Don't expect a vendor-supplied miracle
- Someone will have to do extensive customization
- Try to use small, reusable components

Example: Facebook-Defined Networking

Facebook Defined Networking

Network Automation Caveats

This is what makes networking so complex

NoSQL Borat

@NoSQLBorat

Follow

To make mistake is human. To automatically
deploy mistake to all of servers is DevOps.

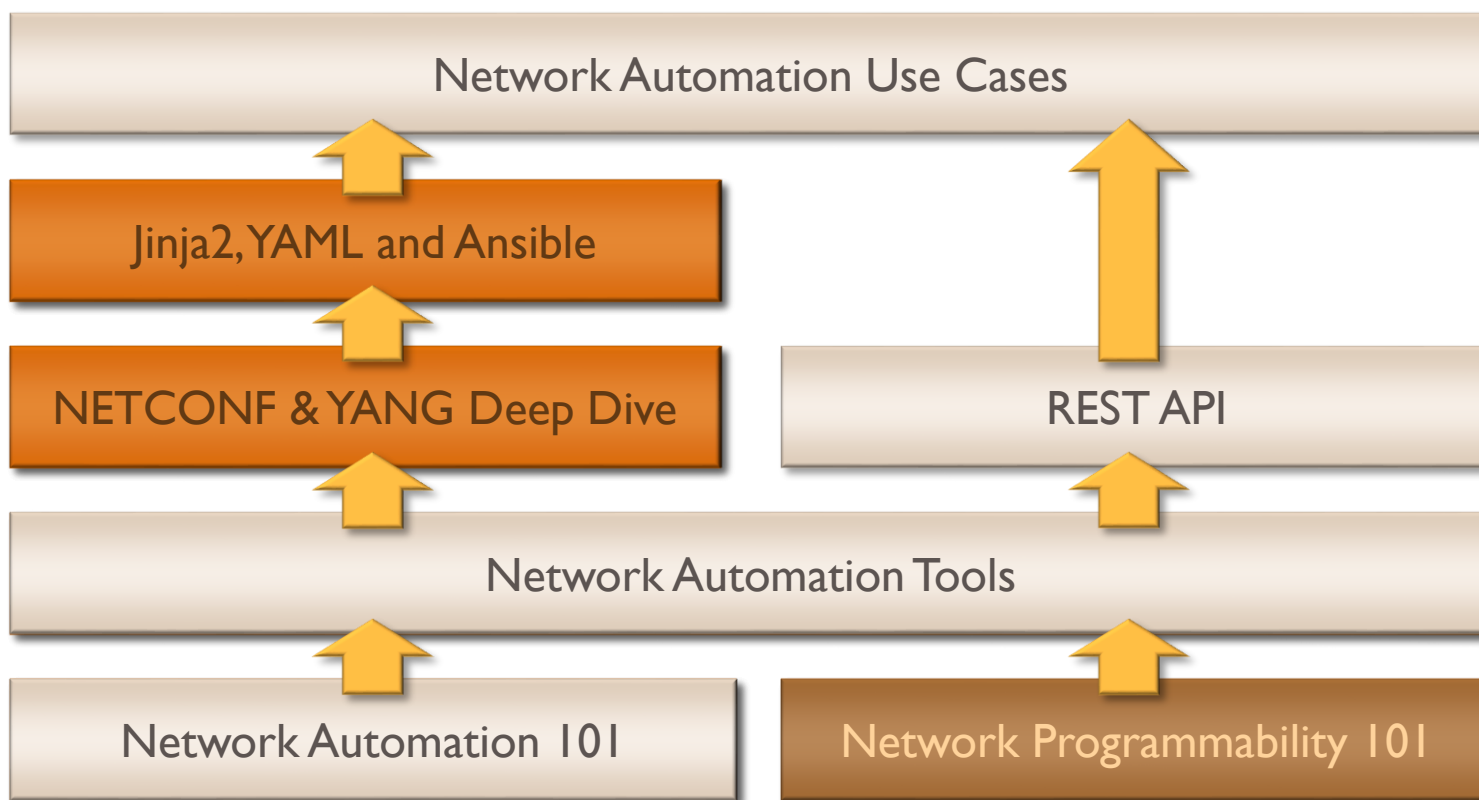

"I SPEND A LOT OF TIME ON THIS TASK.
I SHOULD WRITE A PROGRAM AUTOMATING IT!"

SDN, OPENFLOW AND NFV RESOURCES ON IPSPACE.NET

Software-defined networking (SDN) can mean anything, from programmable network elements to architectures in which control- and forwarding planes reside on different devices.

The resources listed on this page will help you understand SDN, its implications and its applicability in your environment.

A young child stands on a grey tiled floor. A large, light-colored map of Europe is painted on the floor. Several black network switches or routers are placed on the floor, connected by a complex network of colorful cables (red, blue, yellow, green). The map has labels for 'Paris', 'London', and 'Brusset'.
